This is a National Statistics publication

National Statistics status means that official statistics meet the highest standards of trustworthiness, quality and public value.

All official statistics should comply with all aspects of the Code of Practice for Official Statistics. They are awarded National Statistics status following an assessment by the Authority’s regulatory arm. The Authority considers whether the statistics meet the highest standards of Code compliance, including the value they add to public decisions and debate.

It is NHS Digital’s responsibility to maintain compliance with the standards expected of National Statistics. If we become concerned about whether these statistics are still meeting the appropriate standards, we will discuss any concerns with the Authority promptly. National Statistics status can be removed at any point when the highest standards are not maintained, and reinstated when standards are restored.

Appendix A: Key sources

Some of the sources referred to in this publication are National Statistics. National Statistics are produced to high professional standards set out in the Code of Practice for Official Statistics. It is a statutory requirement that National Statistics should observe the Code of Practice for Official Statistics. The United Kingdom Statistics Authority (UKSA) assesses all National Statistics for compliance with the Code of Practice.

Some of the statistics included in this publication are not National Statistics and are included here to provide a fuller picture; some of these are Official Statistics, whilst others are neither National Statistics nor Official Statistics. Those which are Official Statistics should still conform to the Code of Practice for Official Statistics, although this is not a statutory requirement.

Those that are neither National Statistics nor Official Statistics may not conform to the Code of Practice for Official Statistics. Unless otherwise stated, all sources contained within this publication are considered robust.

1. Sources used in this report

1.1 Adult smoking habits in the United Kingdom

Office for National Statistics

The data in this report are collected from the Opinions and Lifestyle Survey (OPN) and Annual Population Survey (APS). It examines cigarette smoking among adults aged 16+ for OPN and aged 18+ for APS, including demographic breakdowns, changes over time, and e-cigarette usage. It includes data for the UK and its constituent countries.

Adult Smoking Habits in the UK is a National Statistic.

https://www.ons.gov.uk/peoplepopulationandcommunity/healthandsocialcare/healthandlifec白沙/bulletins/adultsmokinghabitsingreatbritain/previousReleases

1.2 Measuring tax gaps

HM Revenue & Customs (HMRC)

Statistics and methodological annexes relating to measuring tax gaps. The tax gap is the difference between the amount of tax that should, in theory, be paid to HMRC, and what is actually paid. These are official statistics. https://www.gov.uk/government/statistics/measuring-tax-gaps

1.3 Consumer trends

Office for National Statistics

Spending on goods and services by UK households including household final consumption expenditure (HHFCE) as a measure of economic growth.
ONS Consumer Trends data are National Statistics.

1.4 Health at a glance

Organisation for Economic Cooperation and Development (OECD)

Health at a Glance presents a set of key indicators of health status, determinants of health, health care resources and activities, quality of care, health expenditure and financing in OECD countries.
http://www.oecd.org/els/health-systems/health-data.htm

1.5 Family spending in the UK

Office for National Statistics

An insight into the spending habits of UK households, broken down by household characteristics and types of spending. The report considers expenditure by UK constituent country and English region.

Family Spending in the UK is a National Statistic.

https://www.ons.gov.uk/peoplepopulationandcommunity/personalandhouseholdfinances/expenditure/bulletins/familyspendingintheuk/financialyearending2018

1.6 Health Survey for England

NHS Digital

The Health Survey for England (HSE) series is designed to monitor trends in the nation’s health, to estimate the proportion of people in England who have specified health conditions, and to estimate the prevalence of certain risk factors and combinations of risk factors associated with these conditions. The surveys provide regular information that cannot be obtained from other sources on a range of aspects concerning the public’s health and many of the factors that affect health.

Each survey in the series includes core questions and measurements (such as blood pressure, height and weight, and analysis of blood and saliva samples), as well as modules of questions on topics that vary from year to year.

HSE has been carried out since 1993.

HSE is a National Statistic.

1.7 Hospital Episode Statistics

NHS Digital

Hospital Episode Statistics (HES) processes over 125 million admitted patient, outpatient and accident and emergency records each year.
HES is a data warehouse containing details of all admissions, outpatient appointments and A&E attendances at NHS hospitals in England. This data is collected during a patient's time at hospital and is submitted to allow hospitals to be paid for the care they deliver. HES data is designed to enable secondary use of this administrative data, i.e. use for non-clinical purposes.

It is a records-based system that covers all NHS trusts in England, including acute hospitals, primary care trusts and mental health trusts. HES information is stored as a large collection of separate records, one for each period of care, in a secure data warehouse.

A detailed record is collected for each 'episode' of admitted patient care delivered in England, either by NHS hospitals or delivered in the independent sector but commissioned by the NHS.

Admitted patient care data is available for every financial year from 1989-90 onwards. HES data is now collected monthly.

Admitted patient care data is converted to smoking attributable hospital admissions using the methodology explained in appendix B.

Hospital Episode Statistics, Admitted Patient Care Activity publications are National Statistics

http://content.digital.nhs.uk/hes

1.8 Inflation and Price Indices

Office for National Statistics

A series of publications and datasets showing the rate of increase in prices for goods and services. Measures of inflation and prices include consumer price inflation, producer price inflation, the house price index, index of private housing rental prices, and construction output price indices.

ONS Inflation and Price Indices data are National Statistics.

https://www.ons.gov.uk/economy/inflationandpriceindices

1.9 Local Tobacco Control Profiles for England

Public Health England

The Local Tobacco Control Profiles for England provides a snapshot of the extent of tobacco use, tobacco related harm, and measures being taken to reduce this harm at a local level. These profiles have been designed to help local government and health services to assess the effect of tobacco use on their local populations. They will inform commissioning and planning decisions to tackle tobacco use and improve the health of local communities. The tool allows users to compare one local authority against other local authorities in the region and also compare to the England or regional average.
1.10 Mortality Statistics

Office for National Statistics

Mortality data is converted to smoking attributable deaths using the methodology explained in appendix B.

ONS mortality data are National Statistics.

https://www.ons.gov.uk/peoplepopulationandcommunity/birthsdeathsandmarriages/deaths

1.11 Prescribing Data

NHS Digital

The prescription data included in this report combines GP prescriptions data, taken from Prescribing Analysis and Cost Tool (PACT), and hospital prescriptions data, taken from Prescription Cost Analysis (PCA) system.

Prescriptions are written on a prescription form known as FP10 and each single item on the form is counted as a prescription item. Net Ingredient Cost (NIC) is the basic cost of a drug. It does not take account of discounts, dispensing costs, fees or prescription charges income.

PCA data are National Statistics.

https://digital.nhs.uk/data-and-information/areas-of-interest/prescribing

1.12 Stop Smoking Services

NHS Digital

NHS Stop Smoking Services (formerly known as Smoking Cessation Services) provide counselling and support to smokers wanting to quit, complementing the use of stop smoking aids Nicotine Replacement Therapy (NRT), Bupropion (Zyban) and Varenicline (Champix).

The establishment and development of Stop Smoking Services in the NHS is an important element of the government’s strategy to tackle smoking. Monitoring of the NHS Stop Smoking Services is carried out via quarterly monitoring returns. The quarterly reports present provisional results from the monitoring of the NHS Stop Smoking Services, until the release of the annual bulletin when all quarterly figures are confirmed.

NHS Stop Smoking Services reports are Official Statistics.
Prior to October 2005, Statistics on NHS Stop Smoking Services were collected and published by The Department of Health. [https://www.gov.uk/government/publications](https://www.gov.uk/government/publications)

1.13 Smoking at the Time of Delivery (SATOD)

NHS Digital

Smoking during pregnancy can cause serious pregnancy-related health problems. These include complications during labour and an increased risk of miscarriage, premature birth, still birth, low birth-weight and sudden unexpected death in infancy.

Reducing smoking during pregnancy is one of the three national ambitions in the Tobacco Control Plan published in March 2017, which is “to reduce rates of smoking throughout pregnancy to 6 per cent or less by the end of 2022 (measured at time of giving birth)”. This data collection is designed to provide a measure of the prevalence of smoking among women at the time of giving birth at a local level.

1.14 Smoking, drinking and drug use among young people in England (SDD)

NHS Digital

Smoking, Drinking and Drug Use Survey among Young People is a survey of secondary school children in England which provides the national estimates of the proportions of young people in school years 7 to 11 (who are mostly aged 11 to 15) who smoke, drink alcohol or take illicit drugs.

The first survey in the series was carried out in 1982 and since 1998 the survey has included questions on drinking and drug use as well as smoking.

As well as these core measures, questionnaires since 2000 have included more detailed questions, with the focus alternating between smoking and drinking in one year and drug use the next. The survey became biennial from 2014 onwards.

2. Other resources related to smoking
ASH (Action on Smoking and Health) Smokefree Great Britain survey
ASH is a health charity working to eliminate the harm caused by tobacco use. They produce several statistical reports and fact sheets. They also run the annual Smokefree Great Britain survey, from which information on the use of electronic cigarettes and vaporisers was presented in the ‘Use of e-cigarettes (vaporisers) among adults in Great Britain’ factsheet.

This data is not an Official/National Statistic.

This and other ASH smoking resources are available at:
http://ash.org.uk/home/

Chartered Trading Standards Institute (CTSI)
CTSI has produced various reports relating to its activities around tobacco sales, often in conjunction with Public Health England and/or the Department of Health and Social Care.
http://www.tradingstandards.uk/policy/Improvingthehealthofsociety.cfm

Global Health Observatory (GHO) data: World Health Organisation (WHO)
This is WHO’s main health statistics repository and includes a section on tobacco control.
http://www.who.int/gho/database/en/

National Institute for Health and Clinical Excellence (NICE)
NICE has taken on the functions of the Health Development Agency to create a single excellence-in-practice organisation responsible for providing national guidance on the promotion of good health and the prevention and treatment of ill health:
http://www.nice.org.uk/

NHS Smoking Helpline
Information and help on quitting smoking is available from the NHS Smoking Helpline: 0800 169 0 169.
http://www.nhs.uk/smokefree

Smoke-free Action
Provides information relating to smoke-free legislation.
http://www.smokefreeaction.org.uk/

Smoking Toolkit Study (STS)
The STS tracks national smoking patterns and cessation-related behaviour, and involves monthly interviews of approximately 1,800 adults aged 16 and over in England.

This data is not an Official/National Statistic.
The Scottish Health Survey: Scottish Government
The Scottish Health Survey (SHeS) provides a detailed picture of the health of the Scottish population in private households and is designed to make a major contribution to the monitoring of health in Scotland.

http://www.scotland.gov.uk/Topics/Statistics/Browse/Health/scottish-health-survey

The Welsh Health Survey: Welsh Government
The Welsh Health Survey (WHS) provides information about the health and health-related lifestyles of people living in Wales.

World Health Organization (WHO) Framework Convention Alliance for Tobacco Control (FCTC)
In May 2003, the member countries of the World Health Organization adopted an historic tobacco control treaty, the Framework Convention on Tobacco Control (FCTC), to set internationally agreed minimum standards on tobacco control and to ensure international cooperation on matters such as the illegal trade of tobacco.

www.fctc.org
Appendix B: Technical notes

These notes help to explain some of the measurements used and presented in this report.

1. Estimating smoking-attributable deaths and hospital admissions

1.1 Introduction

Estimates of national smoking attributable NHS hospital admissions and deaths given in Tables 3.1, 3.2, 3.4 and 3.5 are based on three pieces of information:

1. Estimates of smoking prevalence for both smokers and ex-smokers
2. Relative risks for deaths and non-fatal diseases for both smokers and ex-smokers compared to someone who has never smoked for those diseases known to be associated with smoking.
3. Observed numbers of hospital admissions or deaths caused by those diseases which can be caused by smoking.

LA level smoking attributable NHS hospital admissions and deaths given in Tables 3.3 and 3.6 are taken from the PHE Tobacco Control Profiles at the link below:

https://fingertips.phe.org.uk/profile/tobacco-control

The LA level admissions and deaths will not sum to give the same national estimates in tables 3.1, 3.2, 3.4 and 3.5. This is because for both admissions and deaths three years of prevalence data is used to increase the APS sample size at LA level, to ensure the prevalence estimates are robust. Similarly, the LA level deaths in table 3.6 are based on three years of deaths data to smooth out any year on year fluctuations at LA level. Work between NHS Digital and PHE is ongoing to harmonise methodologies.

1.2 Smoking Prevalence

Estimates of the prevalence in England of current and ex-smokers by gender and age are taken from the results of Annual Population Survey (APS). The latest smoking prevalence information used in this report is presented in Table B.1.

Prior to this report, the smoking prevalence data used to calculate national level estimates of admissions and deaths was taken from the Opinions and Lifestyle Survey (OPN). It is now based on the Annual Population Survey (APS) in order to take advantage of the much larger sample size and to be more consistent with the data sources used to produce the LA level estimates. The impact of the change was found to be negligible and more information is given in the methodological change notice which can be found at this link.
1.3 Relative Risks

Fatal diseases

In 2007 a review of the existing methodologies was undertaken by the Department of Health (DH) which resulted in a revised list of diseases for which there was an excess risk of death for current and ex-smokers compared to those people who have never smoked. This was then used to estimate numbers of smoking attributable fatalities in the Health Profile for England (HPE)\(^1,2\). This revised approach has been adopted for this report.

The methodology employed in this report is identical to that used by the DH in the HPE 2008 and HPE 2009. The method differs slightly from the HPE 2007 as it does not reduce the deaths figure to take account of those diseases for which smoking decreases the relative risk, specifically Parkinson’s disease and cancer of the uterus.

The values presented in Table B2 represent the risk of a person who smokes or is an ex-smoker, dying from that disease (unless listed as a non-fatal disease, see below) compared to someone who has never smoked. That is, a value greater than 1 represents an increased risk of death. The risks are only applicable to people aged 35 and over and therefore only deaths of people aged 35 and over have been used in calculating the estimates.

Non-fatal diseases

The relative risks for non-fatal diseases (Crohn’s disease; Periodontal disease/Periodontitis; Age-related cataract; Hip fracture and Spontaneous abortion) are also presented in Table B2 to estimate the numbers of smoking-attributable hospital admissions in England. These risks have been taken from diseases used by Hughes and Atkinson in the report Choosing Health in the South East: Smoking\(^3\), which was based on an update of a 1996 epidemiological study. These diseases have not since been reclassified by the DHSC review as fatal.

The risks for these non-fatal diseases are presented in the same way as those for fatal disease, however they are not gender-specific (with the exception of hip fracture among the 75+ age group) and so the same risks are used to calculate the attributable proportions for both men and women. In the case of spontaneous abortion, the risk is only given for current female smokers.

In order to be consistent with the methodology for fatal diseases, the risks for non-fatal conditions were only applied for hospital admissions of people aged 35 and over.

For fatal diseases, the risks of death were also applied to calculate smoking-related hospital admissions in England. There are some drawbacks to using mortality risks for health

---

\(^2\) Work by Callum and White in Tobacco in London: The Preventable burden, and further work done by Twigg, Moon and Walker in the report The Smoking epidemic: Deaths in 1995 use a correction to the estimates for the smoking-attributable proportion of unspecified site cancer deaths to account for the fact that only a proportion of the unspecified site cancers will be smoking-related. Callum and White states that this correction is arbitrary and this has not been adopted by the Department of Health in the Health Profile for England and has not been adopted here to ensure that our results are easily reproducible. Therefore, the number of unspecified cancer deaths attributed to smoking in this report may be an overestimate.

\(^3\) [www.sepho.org.uk/Download/Public/9593/1/SmokingInSE-Aug2005.pdf](http://www.sepho.org.uk/Download/Public/9593/1/SmokingInSE-Aug2005.pdf)
outcomes and these are discussed by Callum and White in Tobacco in London: The Preventable burden⁴.

### 1.4 Admissions and deaths

Figures on hospital admissions are from NHS Digital Hospital Episode Statistics (HES). The data refer to finished admission episodes of people who are resident in England for the specified period, based on the primary diagnosis.

The number of deaths for men and women in each of the specified age groups are taken from an annual extract of Office for National Statistics (ONS) mortality statistics by cause and by registrations. The data used refer to the number of registered deaths in England.

The tenth revision of the International Classification of Diseases (ICD) was used to identify hospital admissions and deaths from the diseases of interest.

In January 2011 ONS introduced a new version of ICD-10 (version 2010) which replaced version 2001.2. This means that some figures for the number of deaths for 2011 onwards will not be directly comparable to figures for 2001 to 2010.

Further details are available from ONS:

### 1.5 Calculation of Smoking-Attributable Deaths and Admissions

For each of the diseases or groups of diseases shown in Tables B.2, the attributable proportion is calculated as follows:

\[
a = \frac{p_{cur} (r_{cur} - 1) + p_{ex} (r_{ex} - 1)}{1 + p_{cur} (r_{cur} - 1) + p_{ex} (r_{ex} - 1)}
\]

where:

\[
a = \text{attributable proportion for each disease}
\]
\[
p_{cur} = \text{proportion of current smokers}
\]
\[
p_{ex} = \text{proportion of ex-smokers}
\]
\[
r_{cur} = \text{relative risk of current smokers}
\]
\[
r_{ex} = \text{relative risk of ex-smokers}
\]

The equation is reduced where the risks are only given for ‘all smokers’ or ‘current smokers’ (as is the case for some non-fatal conditions).

The estimated number of smoking-attributable hospital admissions or deaths in England is found by multiplying the observed number by the attributable proportion.

---

2. Affordability of tobacco index

The Affordability of tobacco index, as seen in table 1.1 of this publication, gives a measure of the relative affordability of tobacco, by comparing the relative changes in the price of tobacco, with changes in households’ disposable income per capita over the same period (with both allowing for inflation).

The Tobacco Price Index (TPI) shows how much the average price of tobacco has changed compared with the base price (1987).

The Retail Prices Index (RPI) shows by how much the prices of all items have changed compared with the base price (1987).

Both the above indices are produced by ONS.

From this information, we calculate the Relative Tobacco Price Index (RTPI) as follows:

\[ rtpi = \frac{tpi}{rpi} \times 100 \]

\( tpi \) = tobacco price index
\( rpi \) = retail prices index

This shows how the average price of tobacco has changed since the base year (1987) compared with prices of all other items. A value greater than 100 shows that the price of tobacco has increased by more than inflation, during that period.

The Real Households’ Disposable Income Index (RHDI) is an index of total households’ income, minus payments of income tax and other taxes, social contributions and other current transfers, converted to real terms (i.e. after dividing by a general price index to remove the effect of inflation), which tracks, exclusively, changes in real disposable income. It is produced by ONS.

The adjusted RHDI (ARHDI) used in the affordability of tobacco calculation is calculated by dividing the RHDI index by total number of UK adults (aged 18 and over) to give a per capita measure. Revisions to original population estimates published by ONS are applied to the time series when applicable. As population estimates for the most recent year of data do not become available until after publication, the most recent year of estimates available are used for the most recent year of the adjusted RHDI.

The RHDI is based on an annual total (sum of 4 quarters), with the index base year set as 1987, which is therefore equal to 100. This differs from the TPI and RPI for which the index base represents data as at a particular month (January 1987). The annual values reported for these indices are a mean of 12 monthly index values. Therefore in these cases, the index value for 1987 will not necessarily equal 100.

The Affordability of tobacco index is then calculated as follows:

\[ at = \frac{arhdi}{rtpi} \times 100 \]

\( at \) = affordability of tobacco index
\( arhdi \) = adjusted real households’ disposable income index
\( rtpi \) = relative tobacco price index

If the affordability index is above 100, then tobacco is relatively more affordable than January 1987.
More information on the creation of indices used in this calculation can be found on the ONS website at the following link:

https://www.ons.gov.uk/economy/inflationandpriceindices/articles/consumerpriceindicesabriefguide/2017

3. Affordability of tobacco: Forestalling

Forestalling is a tax avoidance practice; whereby excessive quantities of goods are removed for home-use on payment of duty because an increase in the rate of duty is expected. (HMRC 2014).

Receipts were high in December 1998 following the November Budget and associated forestalling. The next Budget took place in March 1999 but as stocks were still available from the November forestalling, no further forestalling took place. The next Budget took place in March 2000. Manufacturers forestalled against this affecting April receipts. There was therefore no forestalling in the financial year 1999/00.
Appendix C: Government policy, targets and outcome indicators

Targets

This set out how tobacco control was to be delivered in the context of the new public health system, and set out to achieve the following national ambitions in England by the end of 2022:

- reduce the number of 15-year olds who regularly smoke from 8% to 3% or less
- reduce smoking among adults in England from 15.5% to 12% or less
- reduce the inequality gap in smoking prevalence, between those in routine and manual occupations and the general population
- reduce the prevalence of smoking in pregnancy from 10.5% to 6% or less

Regulation
The Tobacco and Related Products Regulations 2016 came into force on 20 May 2016, implementing the rules set out in the revised Tobacco Products Directive (TPD), which was published in April 2014, and cover tobacco and smokeless tobacco products, herbal products and for the first time regulate e-cigarettes. The Regulations establish new specific product standards and rules for the safety and quality of ingredients, presentation and advertising of consumer e-cigarettes and refill containers.

E-cigarettes that contain more than 20 mg/ml of nicotine and/or make medicinal claims, such as “This product helps you to quit smoking”, will be regulated under existing medicines legislation, for which the Medicines and Healthcare products Regulatory Agency (MHRA) is responsible. Such products would be considered medicinal and manufacturers must obtain a license from the MHRA before placing on the market.

Those e-cigarettes not captured by medicines regulation will be regulated as consumer products with additional safeguards. These requirements include six month prior notification of a range of information before e-cigarettes or refills are placed on the market; a size limit for e-liquids of 10ml for dedicated refill containers and 2ml for disposable e-cigarettes, cartridges and tanks; the inclusion of health warnings and an information leaflet; child and tamper resistant packaging; and restrictions on the advertisement or promotion of e-cigarettes and refill containers on a number of media platforms.

The Government has adopted regulations to require standardised (plain) packaging of tobacco products for cigarettes and hand rolling tobacco, effective from May 2016. There was a one year transitional period for the sell-through of old stock and from May 2017 all tobacco products on sale in the UK had to comply with these regulations. These new packs also feature larger graphic warnings and are sold in a minimum pack size for cigarettes at 20 sticks and for hand rolling tobacco at 30g weight.

6 http://ec.europa.eu/health/tobacco/docs/dir_201440_en.pdf
New legislation came into force in England and Wales on 1 October 2015, introducing a minimum age of sale of 18 for e-cigarettes and prohibiting the purchase of these products and tobacco products on behalf of someone under the age of 18.

In addition, legislation to protect children from second-hand smoke by ending smoking in private vehicles carrying children also came into force on 1 October 2015.

**Local Stop Smoking Services**

Stop Smoking Services were first set up in 1999/2000 and rolled out across England from 2000/2001. Services provide free, tailored support to all smokers wishing to stop offering a combination of recommended stop smoking pharmacotherapies and behavioural support.

Following a change in the guidance in December 2005, Nicotine Replacement Therapy (NRT) was made available for the first time to adolescents over 12 years, pregnant or breast feeding women and patients with heart, liver and kidney disease. In September 2006, the European Commission approved Champix, generic name Varenicline, as a new pharmacotherapy to help adults quit smoking. The National Institute for Health and Clinical Excellence (NICE) issued guidance in, recommending the use of Champix as an aid to stopping smoking in the NHS.

NICE has since published a range of guidance to support the commissioning and delivery of stop smoking services and this is available on their website www.nice.org.uk.

The National Centre for Smoking Cessation and Training (NCSCT) was established by the Department of Health in 2008 to standardise training for those providing support for and delivering stop smoking services. The full range of training can be accessed at www.ncsct.co.uk/pub_training.php.

The service and delivery guidance for local stop smoking services was updated in 2014 and is available on the NCSCT website – www.ncsct.co.uk.

In addition, the local stop smoking services return now includes the use of unlicensed nicotine containing products, such as e-cigarettes, and these have shown to be effective, in combination with behavioural support, in helping people to stop smoking.

**Review of electronic cigarette use**

In 2015, Public Health England (PHE) published an independent evidence review on electronic cigarettes which concluded that the devices are significantly less harmful than smoking.

The review also found no evidence that electronic cigarettes act as a route into smoking for children or non-smokers. In addition to the evidence review PHE has published its position on electronic cigarettes:

In July 2016, PHE and other public health organisations, issued a consensus statement on e-cigarettes:

Appendix D: How are the statistics used?

Users and uses of the report

From our engagement with customers we know there are many users of this report. There are also many users of these statistics who we do not know about. We are continually aiming to improve our understanding of who our users are in order to enhance our knowledge on what the uses of these data are via recent consultations and feedback forms available online.

In 2016 a consultation was implemented to gain feedback on how to make the report more user-friendly and accessible while also producing it in the most cost-effective way. The results of this consultation can be found at the below link.

Below is listed our current understanding of the known users and uses of these statistics. Also included are the methods we use to attempt to engage with the current unknown users.

**Department of Health and Social Care DHSC) -** frequently use these statistics to inform policy and planning. The Public Health Outcomes Framework was published in January 2012 which sets out the desired outcomes for public health and how these will be measured. The Department of Health publishes policies such as the Tobacco Control Plan (18 July 2017) and all policies can be found via this link: https://www.gov.uk/government/policies/reducing-smoking

**Public Health England** - frequently use these data for secondary analysis and for inclusion in their Local Tobacco Control Profiles: https://fingertips.phe.org.uk/profile/tobacco-control.

**Media** - these data are used to underpin articles in newspapers, journals and other articles.

**Public** - all information is accessible for general public use for any particular purpose.

**NHS** - Use the reports and tables for analyses, benchmarking and to inform decision making.

**Public Health Campaign Groups** - data are used to inform policy and decision making and to examine trends and behaviours.

**Ad-hoc requests** – the statistics are used by NHS Digital to answer Parliamentary Questions (PQs), Freedom of Information (FOI) request and ad-hoc queries. Ad-hoc requests are received from health professionals; research companies; public sector organisations, and members of the public, showing the statistics are widely used and not solely within the profession.

**Unknown Users**

This publication is free to access via the NHS Digital website https://digital.nhs.uk/data-and-information/areas-of-interest/public-health/lifestyles, and consequently the majority of users will access the report without being known to us. Therefore, it is important to put mechanisms in place to try to understand how these additional users are using the
statistics and to gain feedback on how we can make these data more useful to them. On the webpage where the publication appears there is a “Contact us” link at the bottom of the page. Any responses are passed to the team responsible for the report to consider.

We also capture information on the number of times the reports are downloaded, although we are unable to capture who the users are from this. Statistics on Smoking 2018 generated 273 unique downloads (for the report and/or associated files) in the 2 weeks after publication.
Appendix E: Further information

Comments on this report would be welcomed. Any questions concerning any data in this publication, or requests for further information, should be addressed to:
